KCNA7 gene; KV1.7 gene; pc
shaker-related subfamily,

y, member*.

voltage-gated

DEFINITION

HSA310479 4372 bp mRNA lir Homo sapiens mRNA for potassium voltage-gated shaker-related subfamily, member 7 (KCNA7 gene

yated channel, 7 gene).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  NOTE: This is a 'working draft' sequence. It currently consists of 4 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                       During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em: KMBL; Sw:, SMISSPROT; TT:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CTAGCATCCCTGAGTCCTTCTGGTGGGCGGTAGTCACCATGACTACAGTTGGCTATGGAG

                                                                                                                                                                                                                                                                                                                                                                        including hypoplasia and hypomineralisation (NOV5-7), paraneoplastic neurological disorders, e.g. paraneoplastic limbic of brain-stem encephalitis occurring during testicular cancer, diabetes, reproductive health, metabolic and endocrine disorders, gastrointestinal disorders, immune disorders and autoimmune diseases, respiratory disorders, bone disorders, musculoskeletal disorders, leukaemiz/lymphoma and tissue/cell growth regulation disorders (NOV8), lesional psoriatic skin (NOV9-10) and atherosclerosis, abdominal aortic aneurysm and neurological disorders (NOV11). NOVX polypeptide is also useful for identifying an agent that binds to it and a cell expressing NOVX polypeptide is useful for use in treatment of a NOVX related pathology. The antibodies and a polypeptide having 95% sequence identity to NOVX polypeptide are useful for treating a pathological state in a mammal. The present sequence encodes NOV4, a possible voltage gated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            altered cell motility, proliferation and migration e.g. cancer, angiogenesis and wound healing (NOVI-3), neurological disorders, e.g. episodic ataxia, autosomal dominant myokymia, stroke, Parkinson's disease, Alzheimer's disease, non-insulin dependent diabetes mellitus, asthma, hypertension and seizure (NOV4), enamel defects, such as amelogenesis imperfecta and disorders involving enamel defects,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to isolated NOVX (NOVXI-11) polypeptides and the polynucleotides that encode them to the polypeptides, polynucleotides and anti-NOVX antibodies are useful for treating or preventing a pathology associated with NOVX polypeptide in humans and for treating a syndrome associated with human disease e.g. disorders characterised by a syndrome associated with human disease e.g. disorders characterised by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Padigaru

The present invention relates to novel human proteins (NHPS), human ion CC channel proteins and polynucleotides encoding such proteins. Sequences of the invention are useful in therapeutic, diagnostic and pharmacogenomic CC applications. They are useful for the identification of protein coding CC sequences, for mapping a unique gene to a particular chromosome, as CC additional DNA markers for restriction fragment length polymorphism CC (RFLP) analysis and in forensic biology, for screening libraries, CC isolating clones, preparing templates for cloning and sequencing, as CC isolating clones, preparing templates for cloning and sequencing, as CC isolating clones, in microarrays or other assay formats, to screen CC collections of genetic material from patients who have a particular CC medical condition, to identify mutations associated with a particular CC disease and also as a diagnostic or prognostic assay. NHPs are useful CC for the detection of mutant human proteins or inappropriately expressed proteins for the diagnosis of disease, for the generation of antibodies, CC phenotypic manifestations of perturbing the normal function of the CC protein in the body, for identification of other cellular gene products CC compounds that can be used as pharmaceutical agents in the therapeutic CC treatment of mental, biological or medical disorders and diseases. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel human ion channel polynucleotide encoding protein sharing structural similarity with mammalian ion channel proteins, e.g. potassium channels useful in therapeutic, diagnostic and pharmacogenomic applications -

The invention relates to isolated polynucleotide (I) and CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags CC polynucleotides are also used in diagnostics as expressed sequence tags CC (II). (II) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or CC (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as CC a food supplement. (II) and its binding partners are useful in medical CC imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. CC The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity CC and to produce other types of data and products dependent on DNA and CC anino acid sequences. AAS64197-AAS94564 represent novel human CC diagnostic coding sequences of this patent did not appear in the printed CC specification, but was obtained in electronic format directly from WIPO CC at ftp. wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 200

transmembrane domains. The invention provides human potassium channel 52906, 33408 and 12189 nucleic acids and proteins, as well as antisense nucleic acid molecules, recombinant expression vectors, host cells, transgenic animals, fusion proteins, antigenic peptides and antibodies. Also claimed are: a method for detecting the presence of a 52906, 33408 or 12189 nucleic acid; a method for modulating the activity of a 52906, 33408 or 12199 polypeptide using a compound that binds the polypeptide; a method for identifying a compound which modulates the activity of the polypeptide; a method of treating or preventing an ion flux-related disorder using an agent that modulates the activity or expression of a 52906 or 12189 polypeptide, small molecule, antibody, antisense molecule, ribozyme, a triple helix molecule, or a 52906 or 12189 nucleic contains a potassium channel tetramerisation domain, an ion transport protein domain and a core membrane region including The present sequence is that of a partial (see ABB76166), a novel potassium channel cDNA for human 12189 family member. 1218 12189 6

                                                                                                                                                                                                                                                                                                                                                                                                                                                     gated potassium channel. It may be used in drug screening for identification of therapeutics which modulate the channel and, therefore, modulate insulin secretion. Selective antagonists increase insulin release and thereby reduce hyperglycaemia associated with non-insulin-dependent diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New voltage-gated potassium channel gene - used to identify material(s) which can increase insulin release e.g. for treating non-insulin dependent diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 1995-320573/41.

                    These compounds are useful for treating schizophrenia, attention deficit hyperactivity disorder, depression, anxiety, stroke, migraine, ischaemia or neurodegenerative disease (e.g. macular degeneration, Alzheimer's disease, glaucoma, or Parkinson's disease). The compounds that modulate ion channels can be used for treating of cardiovascular diseases (e.g. congestive heart failure, arrhythmia, high blood pressure or restenosis), metabolic diseases and disorders (e.g. diabetes or obesity), hormonal discorders (e.g. polycystic ovarian syndrome or alopecia) and proliferation diseases and cancers. The ion channels are also useful as targets for discovering ligands or drugs to treat many diverse disorders and defects. The ion-x sequences and their modulators may also be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 26-MAY-2000;

                                                                                                                                                                                                                                                                                                                               The invention relates to ion channel polypeptides designated as ion-x (where x is 157-175) and their corresponding nucleic acids. The ion-x sequences and their modulators are useful for the treatment of human diseases and conditions such as neurological or psychiatric disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      treating or diagnosing neurological diseases, e.g. depression, anxiety, Parkinson's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New human ion channel polypeptides and nucleic acids, useful for treating or diagnosing neurological, psychiatric or neurodegenerative diseases, e.g. depression, anxiety, stroke, ischemia, or Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; ion channel; neurological disorder; psychiatric disorder; schizophrenia; attention deficit hyperactivity disorder; depression; proliferation disease; migraine; ischaemia; neurodegenerative disease; macular degeneration; Alzheimer's disease; congestive heart failure; glaucoma; Parkinson's disease; cardiovascular disease; arrhythmia; high blood pressure; restenosis; metabolic disease; neuroprotective; obesity; hormonal disorder; polycystic ovarian syndrome; gene therap
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1579

The method of the invention has hepatotropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, arms reviets which serve and drive metabolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  drug toxicity, drug efficacy and drug metabolism.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumor in a pinvolves detecting the level of expression of two or more liver tissue sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              progression of liver cancer, hepatocellular carcinoma or metastatic tumour in a patient, and differentiation material.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               02-OCT-2001;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (GENE-) GENE LOGIC

```
anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neonlastic agent, and the data is sufficient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   05-JUN-2000

                This sequence represents a novel method for identifying inhibitors or activators (A) of a eukaryotic potassium channel (KC) by applying a test compound to a mutant Saccharomyces cerevisiae cell in which: (i) the three endogenous KC (TRK1, TRK2 and TOK1) are not expressed; but (ii) a eukaryotic KC is expressed heterologously, where the effect of the compound on the eukaryotic KC is then determined. The method is used to identify inhibitors or activators (A) of a eukaryotic potassium channel.

(A) are potentially useful as pharmaceuticals. The method is easily
                                                                                                                                                                                                                                                                                                                                                             WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (I) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (I). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (ABI99202 to ABI99012, encoding the protein sequences in ABB57020 to ABB57374) or by determining the expression profile of a gene group comprising these genes. The
                                                                                                                                                                                                                                                                                                                 Examining the ischemic condition (e.g. occlusive ischemia) by measuring expression levels of particular genes defined in the specification or by determining the expression profile of a gene group comprising these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1579
